

Helping Organizations Combat Cyber Security Attacks

Highly Effective Employee and Customer Cyber Security Training

Traditional cyber security training is not the answer. Boring videos, "death by PowerPoint", and classroom sessions don't provide the level of retention needed to better protect your employees and organization. To drive lasting change in employee behavior, security training must be provided at the right time, and in the right way.

Wombat's training methodology uniquely utilizes learning science principles where users learn by doing and are provided immediate feedback to enhance retention.

Our assessment services allow companies simulate an attack to analyze their vulnerability. We provide extensive reporting with which administrators and security officers can identify how to target training. Wombat's training modules can be delivered to users based upon their personal susceptibility to fall for attacks.

The most effective suite of cyber security software training solutions and highly specialized anti-phishing email filters.

In line with today's culture of short attention spans, the software modules are engaging and interactive and can be completed in less than 10 minutes per module. The training modules complement each other and can be delivered together or stand-alone.

Wombat's complete training suite can greatly enhance your users' cyber security readiness!

10 minutes of training reduces your susceptibility over 70%.

- Assess employee susceptibility in their normal working environment
- Motivate employees to learn through powerful teachable moments
- Provide training content in bite-sized modules
- Teach practical tips focusing on "learning by doing principles"
- Reinforce training and regularly assess your employees

Helping Organizations Combat Cyber Security Attacks

Powerful Phishing Filter Catches More Phish Than Spam Filters

While training equips the end user, our anti-phishing filter is working behind the scenes. PhishPatrol catches significantly more spear phishing emails than existing spam filters. In contrast to solutions that rely solely on blacklists and email signatures, Wombat's advanced machine learning technology enables it to identify threats from the very start of new attacks.

About the Company

Founded in 2008, Wombat Security Technologies grew out of the largest national research project on combating cyber security phishing attacks. Our cyber security training and filtering solutions have successfully helped thousands of employees and customers of global organizations reduce their exposure to security attacks, minimize financial losses and eliminate theft of intellectual property and customer data.

**“Inbound
improvements are
still needed to detect
targeted phishing
emails, which are an
increasing problem.”**

Gartner, Inc. August 2011

**Catch over 70% of the phishing emails
that go undetected by other filters.**
